

Description

EGF (Epidermal Growth Factor) stimulates the growth and differentiation of the fibroblasts and epithelial cells, and plays a crucial role in the development and regeneration of various tissues.

Efficacy

Increases BALB/3T3 proliferation

Description

bFGF rejuvenates both the keratinocyte and the fibroblast, which produce collagen, elastin and hyaluronic acid. bFGF also functions as a modifier of endothelial cell migration and proliferation, as well as an angiogenic factor.

Efficacy

Proliferation test of bFGF in Balb/3T3 fibroblasts
